Profile and Competences

FEG Textiltechnik Forschungs- und Entwicklungsgesellschaft mbH was established in Aachen in 1992 and since then has gained a reputation for exceptional innovations in the field of textile technology.

The company's dedicated and highly qualified staff, in-house research and development capacities as well as intelligent production facilities combine to make FEG Textiltechnik today's leading manufacturer of textile surgical implants in Germany. Under the brand name **DynaMesh®**, an internationally protected trademark, FEG's award-winning implants are successfully marketed in numerous countries around the world.

Constant and close contact with major scientific, medical and technical institutions ensures that FEG's high-quality products meet the latest requirements in terms of patient comfort and surgical handling. The sophisticated quality management system at FEG Textiltechnik is fully certified to DIN EN ISO 13485 for the manufacture of medical devices. All of FEG's products are CE approved (CE 0123) and are approved under relevant national regulations.

Focusing on its core competences and expertise in textile implants, FEG Textiltechnik will continue to set technical benchmarks in the future.

DynaMesh®

Milestones

1992 Founding of:

2003 Certification of:

2011 Development of MRI-visible technology

2014 New 4,200m² offices & production plant

2020 Additional 600m² production/storage capacity

1994 Active in medical technology

2004 First implant for the surgical treatment of hernias

2005 First implant for the surgical treatment of female urinary incontinence

2006 First implant for the surgical treatment of female pelvic organ prolapse

2007 First implant for the surgical treatment of parastomal hernias

2008 First implant for the surgical treatment of male urinary incontinence

2016 First implant for the surgical treatment of hiatal hernias

Business Fields:

- Implants for the surgical treatment of:
 - Hernias
 - Female Pelvic Organ Prolapse
 - Female Urinary Incontinence
 - Male Urinary Incontinence
- Sales in over 50 countries
- More than 70 employees

Biocompatibility

PVDF mesh structures have good biocompatibility (assessed according to ISO 10993) and show significantly lower granuloma formation (scar tissue) [2,3,4]. Therefore, the risk of undesirable foreign body reactions is minimised.

Cross-Sectional View

A comparison of different granuloma thicknesses

Vi001 de	DynaMesh® Implantate - Animation: Fremdkörperreaktion - Vergleich zwischen PVDF und PP https://youtu.be/Cuv6EGpGIAs	
Vi001 en	DynaMesh® Implants - Animation: Foreign Body Reaction - Comparison of PVDF and PP https://youtu.be/kCAIVhwbkN4	

Ageing Resistance

PVDF has been used as a surgical suture material for many decades with great success, even in the most demanding areas of application such as ophthalmology and cardiology [91].

A long-term study over seven years has proven this: The condition of the PVDF surface remains unchanged, filaments are still stable, nothing becomes brittle [2,52].

PVDF Low degradation ++
Minor foreign body reaction +

PVDF-polyvinylidene fluoride

--- Substantial degradation
- Major foreign body reaction **PP**

PP-polypropylene

Dynamometry

Textile implants must reinforce tissue. They have to cushion different forces - including the extreme stresses associated with coughing, sneezing and laughing. What is needed therefore, is a good interaction between stability and elasticity.

Where necessary, DynaMesh® structures are characterised by high shape stability with defined elasticity. They retain their shape and high effective porosity under load [26].

The behaviour of abdominal walls with different mesh implants under load

A study of explanted abdominal walls (source: Aachen University Hospital, Germany)

Tear Propagation Resistance

The multiple meshing technique in warp-knitted* DynaMesh® structures minimises the risk of the zipper effect (once torn, the structure tears further).
The load-specific adapted tear resistance is one of the key properties of DynaMesh® implants.

DynaMesh®

Conventional Mesh

DynaMesh® products are not woven or conventionally knitted, but warp-knitted*.

This technology, unlike any other, makes it possible to make specific variations in the shape and structure of a textile implant, which means that we can construct features with different characteristics in different places within the structure. It is impossible to achieve a more accurate adaptation of implants to the relevant indication.

*Warp-Knitted Fabric

Warp-knitted fabrics are a type of knitted fabric. They are produced industrially on warp-knitting machines via stitch formation from thread systems.

Atraumatic Selvedges

DynaMesh® products are not simply cut from a flat piece of mesh. Special warp-knitting machines produce smooth and therefore atraumatic selvedges (no 'sawtooth' edges!).

Conventional Mesh

DynaMesh®-LICHTENSTEIN

DynaMesh®-SIS soft

Also in three-dimensionally shaped implants

DynaMesh®-IPST-R visible

Effective Porosity

During incorporation, the filaments are enclosed by an internal and external granuloma. When filament distance is too small, there is a risk that the whole intervening space will be filled with scar tissue (closed pores). Sufficiently large pores can prevent this.

How is this prevented? PP implants must have a **pore diameter of at least 1 mm** in all directions, even under load! In the case of **PVDF** implants, a diameter of **0.6 mm** is already sufficient to keep the pores open due to the lower granuloma thickness. Only in this way can local autochthonous tissue form through a pore [6,8].

Textile porosity refers to the permeable component of a mesh implant **before** the body has reacted to it.

Effective porosity refers to the permeable component of a mesh implant **after** the body has reacted to it.

Rule of thumb:

A 'pore' less than 1 mm in diameter is closed by the body with scar tissue
= 0% effective porosity

DynaMesh® visible

Conventional mesh implants are mostly undetectable in diagnostic radiology.

DynaMesh® visible implants can be detected using magnetic resonance imaging (MRI) [7] - both in standard sequences and in high-resolution, three-dimensional images and even films. As such, position and condition of the implant can be determined reliably and accurately.

As it is so easy and safe to take a 'look inside', DynaMesh® visible opens up new perspectives:

- Risk-free monitoring of how healing is progressing
- Monitoring in clinical studies
- More rapid development of pioneering implants - together with world-renowned clinical partners

DynaMesh® visible is the world's first technology to visualise textile implants. The PVDF filament is mixed with ferromagnetic micro-pigments according to a proprietary process that ensures optimum pigment incorporation. This innovation has won an award from the German Federal Ministry of Education and Research (BMBF 01EZ 0849).

DynaMesh® visible

DynaMesh®-PRS visible 3-dimensional remodelling

DynaMesh®-ENDOLAP visible 3-dimensional remodelling

During MRI scans, the part of the body being analysed is scanned step-by-step and deconstructed into many 'wafer-thin optical slices'. At the end, these 'slices' are reconstructed to form 3-dimensional images or motion sequences (remodelling).

The position of the DynaMesh® visible implant can be visualised in detail. The 3D internal view facilitates precise diagnosis.

DynaMesh®-LICHTENSTEIN implants serve to support the tissue and stabilise the fascial structures of the inguinal region. They were specially developed for the conventional repair of inguinal hernias according to Lichtenstein and come in a size which fits the majority of patients and can therefore be used immediately without needing to be cut to size.

DynaMesh®-LICHTENSTEIN

When selecting the mesh size, ensure sufficient overlap!

Less Effort

The elastic zone in the mesh, incorporated by using a special warp-knitting technique, makes it easier for the surgeon to achieve **fold-free** positioning of the implant.

Less Risk

The special slit design enables tunnel modulation with **pressure distribution**.

High Tear Propagation Resistance

The high tear propagation resistance at the end point of the slit **minimises** the risk of **mesh rupture**.

Intraoperative Unfolding

The special textile construction makes it easy to insert the mesh via the trocar and to unfold it intraoperatively. The **antislip** surface and special selvages ensure fold-free positioning. The green marker lines perform a dual function. They are used for rapid orientation and visual monitoring of whether the mesh is positioned tension-free.

Choice of Method

DynaMesh®-ENDOLAP was developed specifically for **endoscopic (TEP)¹⁾** and **laparoscopic (TAPP)** techniques. Should the surgeon consider fixation of the implant to be necessary, all fixation methods may be used.

Pore Size

The special warp-knitted structure results in a high textile porosity. It is the basis for the **effective porosity** after the formation of the foreign body granuloma, which minimises the risk of scar plate formation.

Optimised Shape

The **three-dimensional** form of the mesh enables the adaptation to the anatomy of the groin region.

Standardised Positioning

The implants have a central marking and a longitudinal marking for **alignment** with the inguinal ligament.

CURVATOR®

The pore size of the mesh varies laterally to the longitudinal marking in order to **reduce postoperative creasing** along the length of the inguinal ligament and to ensure high effective porosity.

Dual-Layer Composite Mesh

DynaMesh®-IPOM is a dual-component structure specifically developed for the IPOM technique and consists mainly of high-purity PVDF and a small proportion of polypropylene (PP). The parietal side (PP) promotes rapid and safe ingrowth into the abdominal wall. The PVDF layer on the visceral side forms a barrier to the intestines. PVDF demonstrably decreases the risks of adhesions compared with polypropylene [11] and thus reduces the risk of intestinal erosions. If implantation of several meshes is required (for example, the sandwich technique [9]), the open-pore structure means that implants can easily be overlapped.

Correct Orientation

The parietal side (PP component) has a green marker thread and must face the abdominal wall. The marker thread is located on the front surface and simultaneously shows the correct direction of the elasticity in the craniocaudal direction.

Advantages for the Patients

The open-pore mesh construction facilitates the break-down of seroma and reduces scar plate formation.

Minimal mesh shrinkage is achieved and long-term surgical success with high patient comfort is ensured [9-14] through the open-pore and elastic mesh construction made from PVDF, which offers long-term stability.

Safe Positioning

A requirement for lasting surgical success is that the implant must be correctly positioned.

For this purpose, the implants are incorporated with **green orientation strips**. They must always run in the **craniocaudal** direction.

Safe Placement

The **antislip surface** ensures stable positioning of the mesh. It also facilitates handling and fixation.

The high effective porosity allows direct contact of the tissue layers through the mesh and promotes rapid incorporation.

Please note: DynaMesh®-CICAT must not be placed intraperitoneally.

Classification (Klinge's classification [8])	1 a		

All **DynaMesh®-IPST** implants are used both in laparoscopy and in open surgery. Common applications follow the intraperitoneal onlay mesh technique since the mesh is composed of different materials, which allows intraperitoneal application.

All **DynaMesh®-IPST** implants have a parietal and a visceral side. The parietal side is marked with green thread ends and consists of PVDF and a small portion of PP on the surface, while the visceral side consists of PVDF on the surface.

DynaMesh®-IPST-D visible implants are used for the repair as well as the prevention of parastomal hernia with particularly large overlap in cranial and medial direction with intraperitoneal mesh position (side specificity: left-sided / right-sided stoma).

DynaMesh®-IPST-R implants are used to repair the parastomal hernia without detachment of the stoma from the abdominal wall with intraperitoneal mesh position. The prefabricated slit facilitates placement of the mesh implant around the terminal segment of the bowel.

Handling

The implant is made from a single piece of mesh for a seamless junction with the elastic funnel. **DynaMesh®-IPST** is a **three-dimensional** preshaped implant providing excellent elasticity and flexibility - which facilitates stomaplasty preparation for the surgeon.

Elastic Funnel

The dual-layer composite structure promotes ingrowth into the abdominal wall while at the same time reducing the risks of adhesions on the visceral side.

The **elastic funnel** with no sharp selvedges leads to secure integration of the terminal segment of bowel and reliably prevents parastomal hernia formation [15,61].

Placement

DynaMesh®-IPST-R can be placed without detaching the stoma from the abdominal wall.

The prefabricated slit makes it easier to place the mesh implant around the terminal section of the bowel.

Use and Properties

Product	DynaMesh®-HIATUS
Field of application	hiatal hernia
Surgical access	laparoscopic
Surgical technique	hiatal hernia surgery with implant
Fixation	sutures / adhesives / tacks*
Shape stability	●
Atraumatic selvedges	●
Visible technology	●
Polymer (monofilament)	PVDF
Biocompatibility	●
Ageing resistance	●
Dynamometry	●
Tear propagation resistance	●
No scar plate formation	●
Classification (Klinge's classification [8])	1a

* Tacks may only be used if injury to the pericardium can be ruled out with certainty.

● Applies to all product sizes

Shape Stability Under Load

Conventional mesh structures deform under load. Constriction of the mesh in the region of the hiatus may reduce the distance between mesh implant and oesophagus, eventually causing mesh erosion.

DynaMesh®-HIATUS is based on a sophisticated textile design with rectangular pores, which even under load retain a high degree of shape stability.

High Effective Porosity

Mesh implants tend to shrink after incorporation in vivo.

DynaMesh®-HIATUS has a high effective porosity, which ensures that the mesh implant is thoroughly incorporated. During incorporation, the use of the proven and highly biocompatible PVDF polymer ensures that scarring is kept to a minimum. The good incorporation of the mesh implants combined with less scarring leads to minimisation of mesh shrinkage and permanently high flexibility of the incorporated implant.

Smooth, Warp-Knitted Selvedges

If the mesh does come into contact with the oesophagus in spite of all measures to prevent it, **DynaMesh®-HIATUS** has smooth selvedges that can minimise the danger of mesh erosion.

Retropubic
(inside-out / bottom-up)

Transobturator
(inside-out & outside-in)

DynaMesh®-SIS implants are positioned using the inside-out technique in case of a retropubic tape position, and using the outside-in or inside-out technique in case of a transobturator tape position.

DynaMesh®-SIS implants have a thread on both ends of the sling, which aids fixation to the surgical instrument.

Several reusable instruments are available separately to assist the positioning of DynaMesh®-SIS implants:

DynaMesh®-ISR01:

Instrument for retropubic positioning of DynaMesh®-SIS implants through transvaginal access using the inside-out technique.

Diameter: 5 - 7 cm

DynaMesh®-IST01/-IST02/-IST03:

Instrument set consisting of two instruments (right and left side) for transobturator positioning through transvaginal access using the inside-out or outside-in technique.

DynaMesh®-IVT01:

Instrument for transobturator positioning through transvaginal access using the outside-in technique.

Pectopexy after vaginal/cervical prolapse:

- Two implant sizes are available in the following dimensions
DynaMesh®-PRP soft / visible 03 cm x 15 cm and
DynaMesh®-PRP visible 03 cm x 18 cm.
- With greatly shortened vaginas, e.g., following a radical hysterectomy,
DynaMesh®-PRP visible 03 cm x 18 cm can be optionally used.

Pectopexy after vaginal/cervical prolapse with concomitant cystocele and/or rectocele: (pulsion cystocele / rectocele)

- Additional stabilisation of the affected vaginal wall can be achieved with **DynaMesh®-PRP visible 17 cm x 15 cm.**

Pectopexy after uterine prolapse with uterine preservation:

- With a normal sized uterus, **DynaMesh®-PRP visible 03 cm x 18 cm** should be used and fixed in place on the posterior cervix.

Pectopexy after uterine prolapse with uterine preservation:

- With smaller uteri (below 100 g), anterior fixation of **DynaMesh®-PRP soft / visible 03 cm x 15 cm** can be selected as an alternative.
